

DOCUMENT DESIGN STANDARD

PDF Design & Layout

NoXoZ.be

The reusable visual and technical specification for professional PDF documentation: typography, color palette, navigation, structured content and quality controls.

Creator / Author: Bruno DELNOZ / @NoXoZ.be

Contact: bruno.delnoz@protonmail.com

Document: PDF Design & Layout Specification

Reference: ChatGPT Export v7.0.0 Product Guide

Standard: A4 / interactive / searchable / reusable

Date: 9 October 2026

VISUAL STYLE REFERENCE · 2026

Contents

Interactive navigation · 12 numbered sections · clickable page references · PDF bookmarks.

Design baseline: DeepEcho Faster-Whisper's established PDF style, now documented as a reusable NoXoZ.be reference for future technical publications.

Foundations & page design	01—04	PDF generation & verification	09—12
01 General requirements	3	09 PDF technical properties	6
02 Page format	3	10 Build and validation workflow	7
03 Cover page	4	11 Verified reference output	7

08 Headers and footers	6		

SPECIFICATIONS.pdf — Design & Layout Specification

Project: DeepEcho_faster_whisper
Document: SPECIFICATIONS.pdf
Source: SPECIFICATIONS.md
Design reference: ChatGPT-Export_v7.0.0_Product_Guide.pdf
Creator: Bruno DELNOZ / @NoXoZ.be
Contact: bruno.delnoz@protonmail.com
Status: Design template approved for future regeneration; source revision must follow the current repository version.

1. General requirements

- Generate a professional, searchable, selectable PDF from the complete `SPECIFICATIONS.md`.
- Never summarize, censor, omit, rewrite or simplify source specifications.
- Preserve the original ordering, numbering, tables, lists, Markdown code blocks and changelog.
- Use the attached ChatGPT Export Product Guide **only as the visual reference**, not as a source of document structure or technical content.
- Automatically regenerate the PDF whenever `SPECIFICATIONS.md` changes.
- Always include both `SPECIFICATIONS.md` and `SPECIFICATIONS.pdf` in the full project ZIP.
- Regenerating the PDF does not constitute a final release.

2. Page format

Attribute	Value
Paper	A4 portrait, 210 × 297 mm
Top margin	20 mm
Bottom margin	21 mm
Left/right margins	18.7 mm
Cover	Full bleed, no headers or footers
Main text	Approximately 9 pt
Line height	1.60
Primary font	DejaVu Sans
Code font	DejaVu Sans Mono
Text color	Dark slate/navy

3. Cover page

- Full-page navy-to-blue gradient, approximately `#0E1B31` to `#265497`.
- Large, bold, white **DeepEcho Faster-Whisper** title.
- Subtitle: **Technical Specifications** with the current source version.
- Short description of the project's technical purpose.
- Thin pale-blue horizontal separator.
- Required creator information:
 - Bruno DELNOZ
 - @NoXoZ.be
 - bruno.delnoz@protonmail.com
- Document name, version, source date and release/validation status.
- Clearly distinguish a development/validation candidate from a final release.
- Small NoXoZ.be / DeepEcho signature near the bottom.

4. Interactive table of contents

- Place the table of contents immediately after the cover.
- Automatically extract all numbered Markdown headings.
- Include actual PDF page numbers.
- Every numbered entry must link to its corresponding section.
- Group sections thematically without changing their original section numbers.
- Use a compact two-column presentation.
- Group labels use bold blue text and thin separators.
- Section numbers use a smaller blue accent.
- Generate PDF sidebar bookmarks for major and subordinate headings.

In the V1.1.0-dev document, 135 sections were organized into seven thematic groups:

1. Project foundations — 001-012
2. Installation & Git hygiene — 013-025
3. Model management — 026-041
4. Transcription pipeline — 042-066
5. Files, timestamps & logging — 067-094
6. Validation & documentation — 095-115
7. Compatibility & final acceptance — 116-135

For future versions, **recalculate groups and numbering from the current Markdown**. Do not hardcode the original 135-section limit.

5. Heading hierarchy

Element	Presentation
Document title / H1	Approximately 21 pt, bold navy, blue separator
Main section / H2	Approximately 13 pt, bold blue, horizontal blue rule
Subsection / H3	Approximately 10.2 pt, bold medium blue
Body	Approximately 9 pt, dark slate
Section spacing	Consistent vertical margins
Page breaks	Avoid orphaned headings

Keep numbering and heading text faithful to the Markdown.

6. Color palette

Element	Color
Primary navy	 #14233B
Heading blue	 #244E87
Accent blue	 #295EAC
Table-header blue	 #2759A3
Main text	 #29344A
Alternating table row	 #F1F5FA
Information background	 #EEF3FB
Code block background	 #14233B
Code text	 #E5ECF6
Inline code accent	 #AA3946
Secondary grey	 #8C95A5

7. Tables, code and information blocks

Tables

- Full available text width.
- Blue header with white bold text.

- Alternating very light blue/grey rows.
- Thin separators.
- Automatic text wrapping.
- Prevent clipping or loss of information.

Code blocks

- Dark navy background.
- Light monospace text.
- Blue left border.
- Adequate padding and rounded corners.
- Preserve indentation, commands, paths and CLI arguments.
- Wrap long lines when needed to prevent clipping.

Inline code

- Monospace font.
- Dark red accent.
- Very light background.
- Distinct from normal body text.

Information blocks

- Pale blue background.
- Solid blue left border.
- Comfortable padding.
- Do not alter the meaning of the original Markdown.

8. Headers and footers

All pages except the cover:

- Top left: DEEPECHO / FASTER-WHISPER
- Top right: SPECIFICATIONS · <current version>
- Bottom left: DeepEcho Faster-Whisper · Bruno DELNOZ / NoXoZ.be
- Bottom right: Page X / Y

Use muted grey-blue typography around 7–7.5 pt.

9. PDF technical properties

- Searchable and selectable text, not a PDF made only from images.
- Functional clickable table of contents.
- Functional sidebar bookmarks.
- Functional internal hyperlinks.
- Embedded fonts where supported.

- PDF metadata must include the project title, creator, version and subject.
- No missing glyphs, clipped text, overlapping elements or unnecessary blank pages.
- No modification to the source Markdown during conversion.

10. Build and validation workflow

1. Read the current `SPECIFICATIONS.md` from the latest validated working source.
2. Parse Markdown headings, lists, tables, inline code and fenced code blocks.
3. Generate a styled HTML intermediary from the unaltered content.
4. Build the PDF using a paged-media engine such as WeasyPrint.
5. Add or verify PDF metadata.
6. Verify page count, searchable text, internal links and bookmarks.
7. Render sample pages to images, including cover, contents, technical sections, code blocks and final changelog.
8. Visually inspect for clipping, overlap and typography defects.
9. Verify the final PDF corresponds to the current Markdown revision.
10. Include both source Markdown and final PDF in the deliverable ZIP.

11. Verified reference output

The initial design was validated against the provided `v1.1.0-dev` source:

- Markdown source: 1,612 lines.
- Numbered main sections: 135.
- Generated PDF: 37 A4 pages.
- PDF bookmarks: 145.
- Interactive PDF links: 959.
- Cover includes creator and contact.
- Table of contents includes page references and clickable entries.
- Text is searchable/selectable.

These figures describe **this reference output**, not fixed requirements for future versions. All totals must be recalculated when the source changes.

12. Permanent synchronization rule

Every modification to `SPECIFICATIONS.md` requires regeneration of `SPECIFICATIONS.pdf` before packaging.

The PDF is the formatted reading edition of the Markdown specification, not a separate technical authority. In case of a content mismatch, the current validated Markdown is authoritative, and the PDF must be rebuilt.

Both files are mandatory in every future complete DeepEcho_faster_whisper ZIP delivery.
